

Sealant Compatibility Testing - Saflex® R series PVB interlayer

Saflex® and Vanceva® brands of polyvinyl butyral (PVB) interlayer are plasticized interlayer films that are laminated between two or more plies of glass. The PVB interlayer can react with non-compatible materials with which it may come in contact. As such, direct contact between Saflex and/or Vanceva PVB interlayers with chemicals used in sealants or adhesives should be carefully examined and in some cases avoided.

Compatibility testing is conducted between commercially available sealants and Eastman's Saflex and Vanceva brand interlayers as warranted by product introductions or modifications.

Results are reported from testing, but we do not make sealant recommendations as we cannot and do not control variations and modifications in the sealants which may occur from time to time. Our tests are performed under a strict protocol allowing comparisons to be made between products tested. The test results may not reflect in-situ performance.

Sealants and other adhesives that can maintain intimate contact with the laminate edge throughout testing are evaluated for edge effects that may occur in laminated glass made with Saflex and Vanceva interlayers. The procedure used for testing is documented and published both by Eastman and also by the Glass Association of North America. The sealants and adhesives are made available to Eastman by suppliers, fabricators and manufacturers. Eastman makes no recommendation, either direct or implied, as to the usefulness of this data and states that it is applicable for the materials received and as tested. The data is presented for the informed use of the glazing industry.

A commercially available sealant that is consistently compatible with the laminated glass as tested following the prescribed protocol has not been tested. Based on market trends, silicone sealants as a family seem to be most commonly used with laminated glass. Eastman's experience with testing several silicone based sealants indicate acetoxycure silicone sealants tend to have the largest edge effects for sealants in the silicone family, when the sealant is in intimate contact with the interlayer.

Edge effects are normally seen as clear, very small, 2 mm – 3 mm (0.08 inch – 0.12 inch), edge bubbles, sometimes continuously occurring along an edge, other times very distinct and isolated. The extent of edge effects differs depending upon the sealant or adhesive. Edge effects from sealants and adhesives as seen in this testing are typically maximized in depth at approximately 10 mm (0.39 inch) from the edge. Although a slight discoloration can occur with sulfide containing sealants and adhesives, normally the edge effect is clear and does not cause a color change in the interlayer.

Sealants may contain solvents that can be harmful to the interlayer. In most cases investigated, the sealants considered neutral in curing are routinely better performers in this compatibility assessment than those sealants that have acids (i.e.: acetic acid).

Occasionally a test cycle will result in minimal to no interaction between the laminated glass and the sealant or adhesive. This does not guarantee the same results in field as application, environmental and material deviations can affect the reactions.

Sealants, adhesives, gaskets and setting blocks should be selected firstly on a basis for their desired performance (i.e.: compression, tensile strength, weatherproofing, structural, cosmetic), with edge effects

being a consideration after a performance class or family has been established. Although gaskets and setting blocks can and do come in contact with the laminate edge, the data acquired using this test method is only valid when intimate contact with the laminated glass edge has been maintained for the full duration of the test.

The data reported in the following tables have been rated and defined as follows (Figure 1):

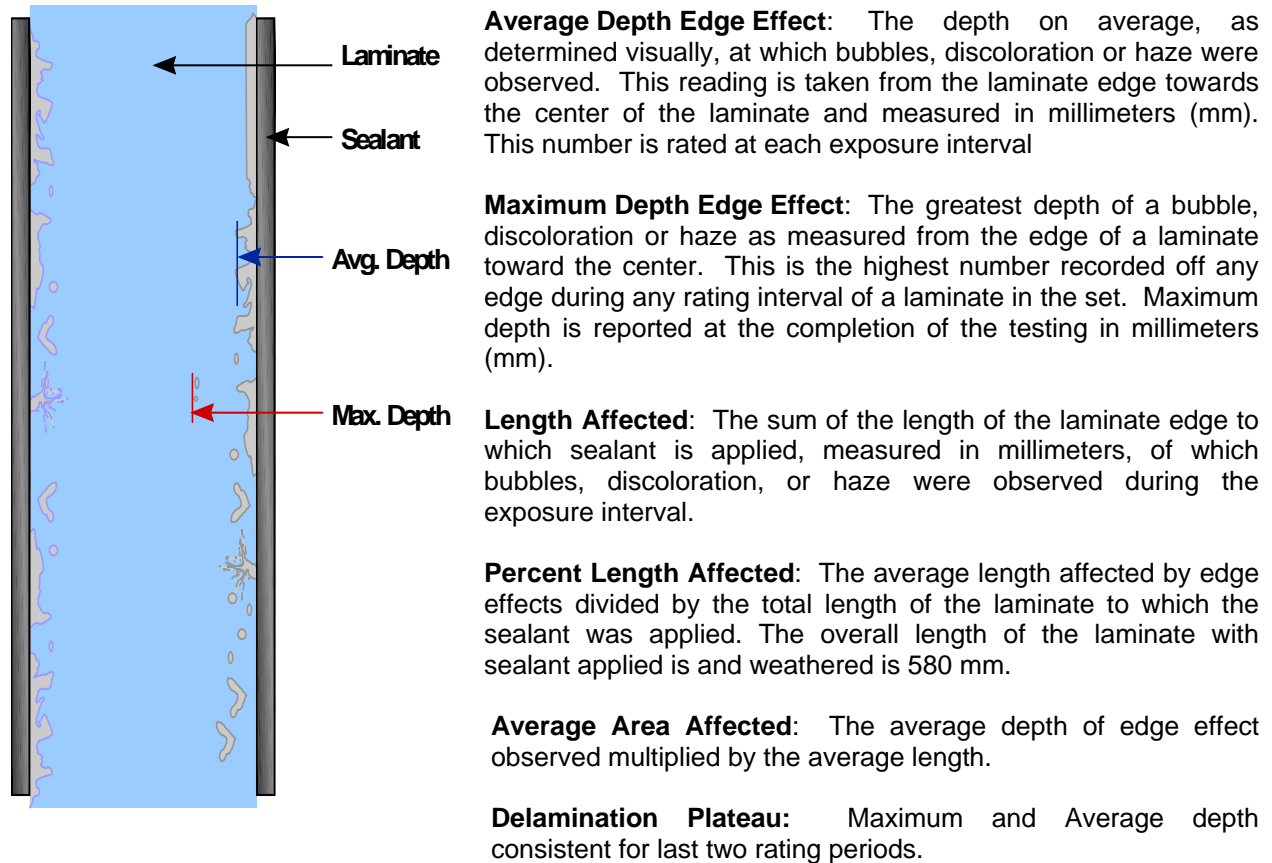

Figure 1: Rating Diagram for Sealant Compatibility Reporting

Evaluation Program Parameters

Interlayer Type:	Saflex® R series PVB interlayer
Interlayer Thickness:	0.76mm (0.030 in)
Exposure Type:	QUV; UV313 bulbs: Irradiance 0.71 W/m ²
Exposure Cycle:	16 hours UV at 66°C, 8 hours of condensation at 60°C
Total Exposure (Hours):	3500
Total Edge (mm):	580

Edge effects are measured at 500 hour intervals through the duration of the exposure. Edge effects can “move” throughout the test and may vary from interval to interval. The maximum depth seen at any time throughout the exposure program is reported.

The tables on the following pages are a summary of sealant and laminated glass compatibility testing conducted at Eastman in accordance with the procedure put forth by the Glass Association of North America (GANA) *Standard Test Method for Laminated Glass Edges when in Contact with Sealants and Glazing Tapes*. The data shown should be used as a reference and guide for sealant selection but should not be deemed as a guarantee of performance.
